

Technical Brief

Stack

- React
- TypeScript
- Vite
- Recharts
- Lucide React
- CSS3
- localStorage
- PWA manifest

Architecture

State Management

현재 프로젝트는 외부 상태 관리 라이브러리 없이 React `useState`, `useMemo`, custom hook으로 구성했습니다.

- `useState`: 필터, 검색어, 모바일 탭, 폼 입력값
- `useMemo`: 캠페인 필터링, 요약 지표 계산, 정렬 결과 계산

- `usePersistentState` : 계정 관리/세션 설정 localStorage 저장

Data Model Examples

```
export interface Campaign {  
  id: string;  
  name: string;  
  channel: Channel;  
  status: 'Scale' | 'Optimize' | 'Maintain' | 'Pause';  
  revenue: number;  
  adCost: number;  
  roas: number;  
  nextAction: string;  
}
```

```
export interface TeamMember {  
  id: string;  
  name: string;  
  email: string;  
  role: Role;  
  status: 'active' | 'pending' | 'suspended';  
  device: string;  
  lastActive: string;  
}
```

Production Expansion Plan

1. Replace Mock Data with REST/GraphQL API
2. Add Auth with Supabase/Firebase/NextAuth
3. Enforce RBAC on the server
4. Add CSV upload and validation pipeline
5. Add PDF report generation
6. Add test suite with Vitest/React Testing Library
7. Build React Native/Expo mobile app
